A DESCRIPTIVE STUDY TO ASSESS THE PRACTICE OF BREASTFEEDING AMONG PRIMI MOTHERS AT SELECTED HOSPITALS, PUDUCHERRY

*Mrs. V. Revathy

INTRODUCTION

“There is no substitute for mother’s love, there is no substitute for mothers milk.” William Gouge

The birth of the baby is an important event in the family. It is therefore important for the mothers to have a healthy baby. Breast milk is the best food for the babies as breast fed babies are healthier than formula fed babies. Breast milk is a species specific complete food. It is easily digested and well absorbed by the newborn. Protection against infection and facilitate mother infant bonding and promotes better brain growth. For the mother breast feeding helps in involution of uterus, delays pregnancy and lower risk of breast and ovarian cancer. In countries with high infant mortality rate, artificially fed infants are 14 times more likely to die of diarrhea than are breast fed and 4 times more likely to die of pneumonia. Artificially fed infants are 5 times likely to require hospitalization for treatment of infections globally, less than 40% of infants under six months of age are exclusively breastfed.

STATEMENT OF THE PROBLEM:

A descriptive study to assess the practice of breastfeeding among primi mothers at selected hospitals, Puducherry

OBJECTIVES

1) To assess the practice of breastfeeding among primi mothers

2) To determine the association between the practice of breastfeeding among primi mothers with selected demographic variables

ASSUMPTIONS

✓ Primi mothers are not aware of proper technique of breast feeding
✓ Primi mothers will vary in breastfeeding practices according to socio-cultural factors

MATERIALS AND METHODS

Research approach

A descriptive approach was considered most suitable for the study, as the aim was to assess the practice of breastfeeding among primipara mothers.

Research design

Non experimental descriptive survey research design

Settings of the study

The study was conducted in post natal ward at selected hospitals, Puducherry

Population

Post natal mothers

Sampling technique

In this study Purposive sampling technique was used

*M.Sc., Nursing II year, Vinayaka Missions College of Nursing, Puducherry.
In this study 30 Primipara mothers were selected who fulfil the inclusion criteria.

**CRITERIA FOR SELECTION OF SAMPLE**

a) **Inclusion criteria:**
- Primipara mothers who can understand either English or tamil language.
- Primipara mothers who are willing to participate for study

b) **Exclusion criteria:**
- Mothers who have undergone caesarean section
- Mothers who are not available at the time of study

**INSTRUMENTS USED FOR THE STUDY**

Based on the objectives of the study observational checklist was developed to assess the practice regarding technique of breastfeeding among primipara mothers.

**Description and development of the tool**

In this study the data collection instrument consists of two sections. They are

**Section A:**

It consists of demographic variables which includes age, educational status, type of family, religion, area of residence, occupation, family monthly income and source of information on breastfeeding.

**SectionB:**

Assessment of practice regarding technique of breastfeeding. This section was observed using a checklist consists of 15 questions to assess the practice of primipara mothers regarding technique of breastfeeding. Each question has “yes” or “no” response. For each correct response score 1 was given and for each incorrect score 0 was given.

**MAJOR STUDY FINDINGS**

The Major findings are summarized as follows

i) **Description of demographic variables**
   - Higher percentage 14(47%) of primipara mothers regarding breastfeeding was in the age group of 25-30 years.
   - Majority of primipara mothers (30%) had both primary and secondary education.
   - Majority of primipara mothers 18(60%) belongs to nuclear family.
   - 19(73%) of the mothers belongs to Hindu, 4(14%) of the mothers belongs to Christian and 7(23%) of the mothers belongs to Muslim.
   - Majority of primipara mothers 21(70%) were from rural and 9(30%) were from urban community respectively.
   - Most of the primipara mothers were homemakers 15(50%).
   - Monthly income of majority of primipara mothers 14(47%) were below Rs.5,000/-
   - Half of the primipara mothers 15(50%) had no previous information on breastfeeding.
ii. Practice of breast feeding

- 11 (37%) of primi mothers had done appropriate level of breast feeding and 19 (63%) of primi mothers had done inappropriate level of breast feeding.
- The mean and standard deviation were 6 and 1.95.

iii) Association between practice of breast feeding and selected demographic variables

- The study shows that there was statistically significant association between the practice of breastfeeding among primi mothers with selected demographic variables such as age, educational status, type of family, religion, area of residence, occupation, family monthly income and there was no association for previous source of information.

CONCLUSION:

In this study, majority of primi mothers follow inappropriate level of breastfeeding practices. Statistically significant association was found between the practice of breastfeeding among primi mothers with selected demographic variables such as age, educational status, type of family, religion, area of residence, occupation, family monthly income and there was no association for previous source of information.

It indicates that the practice of breastfeeding technique have to be improved. To reinforce their practice, adequate health education and health awareness programmes will be more effective among primipara mothers.
